# Bachelor of Science (B.Sc.) Semester-IV (C.B.S.) Examination <br> MATHEMATICS ( $\mathbf{M}_{8}$-Mechanics) <br> <br> Paper-II 

 <br> <br> Paper-II}

Time : Three Hours]
[Maximum Marks : 60
N.B. :- (1) Solve all the five questions.
(2) All questions carry equal marks.
(3) Questions $\mathbf{1}$ to $\mathbf{4}$ have an alternative. Solve each question in full or its alternative in full.

## UNIT—I

1. (A) Prove that any system of coplanar forces acting at different points of rigid body can be reduced to a single force through a given point and a couple.
(B) Five weightless rods of equal length are joined together so as to form a rhombus ABCD with one diagonal BD . If a weight W is attached to C and the system is suspended from A , show that there is a thrust in BD equal to $\frac{\mathrm{W}}{\sqrt{3}}$.

## OR

(C) Derive the Cartesian equation of a common catenary in the form $y=\cosh \left(\frac{x}{c}\right)$.
(D) If $\alpha$ and $\beta$ be the inclinations to the horizon of the tangents at the extremities of a portion of a common catenary and $l$ be the length of the portion, show that the height of one extremity over the other is $l \cdot \sin \left(\frac{\alpha+\beta}{2}\right) / \cos \left(\frac{\alpha-\beta}{2}\right)$, the two extremities being on one side of the vertex of the catenary.

## UNIT-II

2. (A) If the velocities of a particle along and perpendicular to a radius vector from a fixed origin are $\lambda r^{2}$ and $\mu \theta^{2}$, show that the equation of the path is $\frac{\lambda}{\theta}=\frac{\mu}{2 r}+c$ and the components of accelerations are $2 \lambda^{2} r^{3}-\mu^{2} \frac{\theta^{4}}{r}$ and $\lambda \mu r \theta^{2}+2 \mu^{2} \frac{\theta^{3}}{r}$.
(B) A particle is describing a plane curve. If the tangential and normal accelerations are constant throughout the motion, show that the angle $\Psi$, through which the direction of motion turns in time ' t ' is given by $\Psi=\mathrm{A} \log (1+\mathrm{Bt})$.

## OR

(C) Show that a particle executing Simple Harmonic Motion requires $\frac{1}{6}$ th of its period T, to move from the position of maximum displacement to one in which the displacement is half the amplitude.
(D) For a particle moving in Simple Harmonic Motion with amplitude 'a' and periodic time ' T ', derive the expression of velocity ' $v$ ' in terms of $a, T$ and $t$ and show that $\int_{0}^{T} v^{2} d t=\frac{2 \pi^{2} a^{2}}{T}$.

## UNIT-III

3. (A) Prove D' Alembert's principle that "the virtual work on a mechanical system by the applied forces and the reversed effective forces is zero" i.e.

$$
\sum_{\mathrm{i}}\left[\overline{\mathrm{~F}}_{\mathrm{i}}^{(\mathrm{a})}-\overline{\mathrm{p}}_{\mathrm{i}}\right]^{\circ} \delta \overline{\mathrm{r}}_{\mathrm{i}}=0, \mathrm{i}=1,2, \ldots ., \mathrm{n}
$$

where $\overline{\mathrm{F}}_{\mathrm{i}}^{(\mathrm{a})}$ is the applied force on the $\mathrm{i}^{\text {th }}$ particle of the system.
(B) Derive Lagrange's equations of motion in the form $\frac{d}{d t}\left(\frac{\partial L}{\partial q_{j}}\right)-\frac{\partial L}{\partial \dot{q}_{j}}=0, j=1,2, \ldots \ldots, n$
for conservative system, where $\mathrm{L}=\mathrm{T}-\mathrm{V}$ is the Lagrangian of the system.

## OR

(C) Define Rayleigh's dissipation function R , and show that the rate of energy dissipation due to friction is $2 R$.
(D) If $L$ is the Lagrangian for a system having $n$ degrees of freedom, show that $L^{\prime}=L+\frac{d F}{d t}$ also satisfies Lagrange's equation, where $F=F\left(q_{1}, q_{2}, \ldots, q_{n}, t\right)$ is any arbitrary differentiable function.

## UNIT-IV

4. (A) Prove that the problem of motion of two masses interacting only with each other can always be reduced to a problem of motion of a single mass.
(B) For a system moving in a finite region of space with finite velocity, prove that the time average of the kinetic energy is equal to the virial of the system i.e. $\overline{\mathrm{T}}=\overline{-\frac{1}{2} \sum_{\mathrm{i}} \overline{\mathrm{F}}_{\mathrm{i}}{ }^{\circ} \overline{\mathrm{r}}_{\mathrm{i}}}$.

## OR

(C) For a central force field F, derive the path of a particle of mass ' $m$ ' in the form :

$$
\begin{equation*}
\frac{\mathrm{d}^{2} \mathrm{u}}{\mathrm{~d} \theta^{2}}+\mathrm{u}=-\frac{\mathrm{m}}{\mathrm{~h}^{2} \mathrm{u}^{2}} \mathrm{~F}\left(\frac{1}{\mathrm{u}}\right), \text { where } \mathrm{u}=\frac{1}{\mathrm{r}} \tag{6}
\end{equation*}
$$

(D) A particle moves on a curve $r^{n}=a^{n} \cos n \theta$ under the influence of a central force field. Prove that $\mathrm{f}(\mathrm{r}) \propto \mathrm{r}^{-(2 \mathrm{n}+3)}$.

## Question-V

5. (A) Define virtual work done and state the principle of virtual work.
(B) Show that in a catenary, $s=c \sinh \frac{x}{c}$.
(C) Find the normal acceleration of a particle describing a cycloid $\mathrm{s}=4 \mathrm{a} \sin \psi$.
(D) Show that if the displacement of a particle is $x=a \cos n t+b \sin n t$, then it executes Simple Harmonic Motion.
(E) Write the Lagrangian of a particle moving in plane, in polar coordinates. $11 / 2$
$\begin{array}{ll}\text { (F) Define velocity dependent potential. } & 11 / 2\end{array}$
(G) Show that the path of a particle in a central force field lies in one plane. $11 / 2$
(H) If the conservative force F is given by $\mathrm{F}=\frac{-\mathrm{k}}{\mathrm{r}^{2}}$, find the potential V .
